5. Interpretation and limitations

This report is generated from the same public dashboard JSON used by the website. BirdNET results are automated candidate predictions, not independently verified observations. Repeated detections do not represent unique individual animals. Diversity indices describe candidate-label frequencies, not a complete ecological census. Counts depend on recording effort, microphone placement, weather and model settings.

• Species list is restricted to a conservative allowlist of Connecticut bird candidates.

• These are automated model predictions, not independently verified observations.

• Non-bird and out-of-region classifier labels are excluded from the species list; original recordings and source records are not deleted.

• Some real local or migratory species may be absent because the allowlist is intentionally conservative.
